

Chapter 7

1-6, 9, 11

Class - blueprint/template defines what object will have

1. The Pi variable and radius variable
2. The original class name exactly
3. Private is encapsulated in the class and cant be called outside, while public can be called anywhere
4. Radius should be private and use a method to call it instead of direct
5. a) Roo b) x is the data member c) getX d) setX e) factor f) public Roo g) 4
6. A class is a blueprint or template that defines what an object will have while an object is an actual instance of that class
9. a) z b) y and x (z technically but cannot be changed) c) y d) x and z
11. Overloading is to add multiple inputs to methods using the same name while overriding changes the core behaviour of the method itself.
