

Credit Name: Procedural Programming 1

Assignment Name: Chap 6

**The following questions can help you in thinking critically about your problem-solving processes:**

#### **Understanding the Problem**

How did you approach understanding the challenge? When I ever faced a problem such as type error etc, I approached it step by step and did outputs at every part of the process that may have caused a problem

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

#### **Planning the Solution**

Did you create a plan or break the problem into smaller steps before coding?

How did you decide on the tools, data structures, or algorithms to use?

I chose data structures based on how the credit focused heavily on the implementation of methods and calling. I then focused on algorithms to optimize my code

#### **Implementation**

Did you write the code in small pieces or attempt the entire solution at once?

How did you test your solution along the way to make sure it was working?

I wrote the code in pieces so as to make the process simpler to debug and improve. Also methods helped with separating my code into many parts

#### **Overcoming Challenges**

What part of the problem was the most difficult for you?

How did you handle moments when you felt stuck or unsure of what to do next?

The most difficult was figuring out how a method differed from a function in python and what implications that had (for ex: stricter syntax, structure)

#### **Learning**

Was there anything you learned that you think will help you with future challenges?

Learning methods may be crucial for later parts of the semester like object oriented programming and could help with speeding up time it takes to write code
