

Credit Name: Data Structures
Assignment Name: SortedArray

Error Log Entry

What error message did you encounter (if any)? Output error.

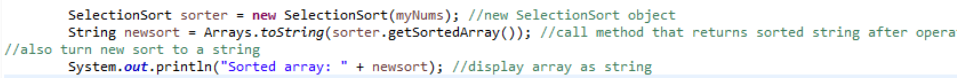

What unexpected behavior did your program exhibit? When trying to output my sorted array it would not show as readable values but as hexcode (mastery.SelectionSort@6acbcfc0). When trying to change the values using Arrays.toString it would not show

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.) Calling an array to be printed only shows its "location" in the memory shown by hexcode

Include a screenshot of specific lines of code. 

How did you fix the issue? Use a method to get the sorted array then change that to a string.

Provide the corrected code or solution using a screenshot.

```
SelectionSort sorter = new SelectionSort(myNums); //new SelectionSort object
String newsort = Arrays.toString(sorter.getSortedArray()); //call method that returns sorted string after opera
//also turn new sort to a string
System.out.println("Sorted array: " + newsort); //display array as string
```
