

Chapter 9

#1 - 4, #6 - 8, and #10 - 12

1.2

2. `quantities = new int[20];`

3. `Double[] heights = {1.65, 2.15, 4.95};`

4. `for (int grade : grades) {
 System.out.print(grade);
}`

6. If you enter a single element of an array, a copy of that element will be made inside the loop and changing it will not change the element in the array, but entering the entire array makes it reference the same location in memory and changing an element will change the actual array too.

7. Offset is required in case you need specific parts of the array like a couple letters out of an array of the alphabet. Also in case you want to put new info into the array but in the middle of the array not the end.

8. `i`

10. In case you have an array that can be updated/added to later. For example if you have a classroom array with student names and another student enrolls a dynamic array can easily add another name while a static one may not have room.

11. It uses `.equals()` to determine if object passed is in the array

12. Using `.equals()` to determine if they are similar or not
